The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in castivities. The nucleotide sequences are used to elucidate the cantibiotic activities. The nucleotide sequences are used to elucidate the comblecular basis for the biosynthesis of the mitosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g. cantibiotics, anti-inflammatory agents, anti-cancer agents, chronic combernation pulmonary disease as well as other disease involving crespiratory inflammation, or cholesterol-lowering agents or as crop protection agents (e.g. fungicides or insecticides) as well as other disease involving crespiratory inflammation, or cholesterol-lowering agents or as crop protection agents (e.g. fungicides or insecticides) as well as comparatory disease. Sequences AAC55812-C55814 and CAAB32485-B32542 represent mitomycin biosynthetic gene cluster DNA captagness and encoded proteins. Sequences AAC55812-C55814, captagness and captagness a

Mitomycins are a group of natural products that contain a variety of functional groups, including amino benzoquinone and axiridine ring systems. The S. lavendulae mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 55kb of DNA. The invention includes an expression cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antibiotics, anti-inflammatory agents, anti-cancer agents, immune-enhancers, immunosuppressants, agents to treat asthma, chronic obstructive pulmonary disease as well as other disease involving respiratory inflammation, or cholesterol-lowering agents or as crop protection agents (e.g. fungicides or insecticides) as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in antiasthmatic, antiinflammatory, cytostatic, immunomodulatory, and antibiotic activities. The nucleotide sequences are used to elucidate the
                                                                                                                                                                                                                                                                  8612
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAB32485-B32542 represent mitomycin biosynthetic gene cluster DNA sequences and encoded proteins. Sequences AAC55812-C55814, AAC55850-C55856 and AAC55862-C55869 represent PCR primers used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 molecular basis for the biosynthesis of the mitosane ring system, as as to engineer the biosynthesis of novel natural products, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 26; Figure 22; 399pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (MINU )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-SEP-2000
                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 12249

The S. lavendulae mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 55kb of DNA. The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and protein sequences and the transformed host cells of the invention result in antiasthmatic, antiinflammatory, cytostatic, immunomodulatory, and antibiotic activities. The nucleotide sequences are used to elucidate the molecular basis for the biosynthesis of the mitosane ring system, as well as to engineer the biosynthesis of novel natural products, e.g.
                                                                                                                                                                                                                                        AAB32485-B32542 represent mitomycin biosynthetic gene cluster DNA sequences and encoded proteins. Sequences AAC55812-C55814, AAC55850-C55856 and AAC55862-C55869 represent PCR primers used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to isolated and purified nucleic acid from the mitomycin biosynthetic gene cluster. Mitomycins are natural products that contain a variety of functional groups,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acid molecule comprising mitomycin biosynthetic gene cluster useful for cloning mitomycin biosynthetic genes for elucidating the molecular basis of mitosane ring system biosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                antibiotics, anti-inflammatory agents, anti-cancer agents,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fragments as indicated in the features table. The DNA or a hybrid vector containing it can be used to prepare an ICA or derivatives and precursors, either by allowing production in previously incapable organisms or by improving yields. In particular, the antiblotic staurosporin can be produced. Staurosporin is known to have inhibitory activity against fungi, yeasts, and Ca2+/phospholipid-dependent serine/threonine protein kinases (PKCs). Staurosporin also has antiproliferative activity and can inhibit platelet aggregation. The present sequence can also inactivate ICA biosynthesis genes and can be used in PCR amplification. An advantage of this is that productivity of staurosporin-synthesising Streptomyces is improved over natural strains yielding only low concentrations.

                                                                                           Bacteria signal to one another to coordinate expression of specific genes in a cell density dependent fashion. This "bacterial signalling" is called "quorum sensing and response". Quorum sensing allows a bacterial species to sense its own number and regulate gene expression according to population density. The present sequence is an open reading frame (QRF) of a Pseudomonas aeruginosa quorum sensing controlled gene. Inhibitors of quorum sensing signalling renders a bacterial population more susceptible to treatment. The present invention relates to a method for identifying modulators of quorum sensing signalling in Pseudomonas aeruginosa bacteria. Modulators of quorum signalling in Pseudomonas aeruginosa bacteria. Modulators of quorum signalling may be used to treat P. aeruginosa infections. P. aeruginosa is an opportunistic pathogen of immunocompromised individuals (burn patients, cystic fibrosis patients, patients undergoing immunosuppressive therapy and patients with AIDS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1047

The preparation method comprises contacting carbonyl compounds with microbes containing a polyketide synthase gene. Pyran-2-one derivatives can be used as synthetic intermediates for drugs and agricultural chemicals. They can also be used as additives for thermosensible transfer paper. The present sequence encodes the specifically claimed Streptomyces griseus RppA protein, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparation of pyran-2-one derivative, used as intermediate and additive for thermosensible transfer paper, comprises contacting carbonyl compound with microbe containing polyketide synthase ge

The present sequence encodes the actinomycetes polyketide synthase protein isolated from Streptomyces griseus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS

The cleanfolide polyketide synthase (PKS), also known as 8,8a-deoxyoleanfolide synthase, is encoded by three open reading frames (ORF), designated oleAI, cleAII and cleAII. The PKS is a type I "modular" enzyme, where each ORF encodes 2 extender modules and the first ORF also encodes the loading module. Each module is composed of at least a ketosynthase (KS), acyl-transferase (AT) and an acyl carrier protein (ACP) domain. The cleanfolide PKS loading module contains an inactivated KS, called KS-Q, where Q is the abbreviation for glutamine, present instead of the active site cysteine required for
glutamine, present instead of the active site cy
activity. The large multifunctional PKS enzymes

                                                                                                                                                                                                       decarboxylative condensations between acylthioesters followed by cycles cof varying beta-carbon processing activities. The macrolide product of the PKS, 8,8a-deoxyoleandolide, is further modified by epoxidation and glycosylation to yield oleandomycin, an antibacterial polyketide. The converse an isolated recombinant DNA compound, comprising a coding sequence for a domain of loading module or any one of extender modules 1-4 or 1-6, including an oleandolide PKS operably linked to a promoter. Also discussed are recombinant oleandolide PKS in which the module I KS domain is inactivated by deletion or other mutation. In particular, the inactivation is mediated by a change in the KS domain that renders it incapable of binding substrate (the KS1-0 mutation), rendered by mutation in the codon for the active site cysteine. The cleandolide PKS is useful for synthesizing polyketides, which are useful as antibiotics and motilides. Heterologous expression of oleandolide PKS in host cells such as Streptomyces coelicolor and S. lividans is also made possible. Unmodified oleandolide compounds can be provided to cultures of Saccharopolyspora erythraea and converted to the

                                                                                                                                  The present sequence is the last 21184 bases of the enediyne C-1027 gene cluster from Streptomyces globisporus. Enedlyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which acts by damaging DNA. The sequences within the gene cluster, and the proteins they encode, can be used in the treatment of cancer, along with antagonists of the protein. Each of the open reading frames is specifically claimed, excluding ORF 9, which encodes CagA.

cc antiasthmatic, antiinflammatory, cytostatic, immunodulatory, and cantiblotic activities. The nucleotide sequences are used to elucidate the cmolecular basis for the biosynthesis of the mitosane ring system, as well cas to engineer the biosynthesis of novel natural products, e.g. antibiotics, anti-inflammatory agents, anti-cancer agents, chronic commune-enhancers, immunosuppressants, agents to treat asthma, chronic constructive pulmonary disease as well as other disease involving crespiratory inflammation, or cholesterol-lowering agents or as crop crotection agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents (e.g. fungicides or insecticides) as well as composition agents 
                                                                                                                                                                                                                                                                                                                                                                                                                     mitomycin biosynthetic gene cluster comprises 47 mitomycin genes spanning 55kb of DNA. The invention includes an expression cassette comprising a mitomycin biosynthetic gene operably linked to a promoter, and host cells transformed with the cassette. The nucleotide, and prote sequences and the transformed host cells of the invention result in

RESULT :
 Cytochrome P450soy was purified from S.griseus ATCC 13273. Two CC similar forms of P450soy were isolated. P450soy-delta, is derived CC from P450soy by in vitro proteolysis during isolation. One of the Ctryptic peptide fragments of cytochrome P450soy and of of the CC P450soy-delta protein were subjected to automated degradation. The CC N450soy-delta protein were subjected to automated degradation. The CC N450soy-delta protein were subjected to automated degradation. The CC N450soy-delta protein were subjected to automated degradation. The CC N450soy-delta protein were subjected to automated degradation. The CC N450soy-delta protein were subjected to automated degradation. The CC N450soy-delta protein peptide was made. It consists of the Sequences in Q43290-23. The Oligo mixture was end-labeled and used CC to probe the EMBL4 library of S.griseus DNA. Hybridising plaques CC were isolated and a 4.8kb Saci DNA fragment was isolated from one CC clone that hybridised to the Oligo probe mixture. As segment of the CC 1.8kb fragment was sequenced and found to contain an ORF. Within CC this ORF was a section that corresp. exactly to the AA sequence CC determined from the cytochrome P450soy protein was called soyC. Five C nucleotides downstream from the stop codon for soyC another ORF was cidentified. This ORF encodes an apparent ferredoxin-like protein.

CC The gene was designated soyB and the protein ferredoxin-soy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CDS

                                                                                                                                                                                                                                                                                                              The eryF gene encodes the 6-hydroxylase component of the cytochrome P450 monoxygenase system responsible for the hydroxylation of 6-de-oxyerythronolide B to erythronolide B. Interruption of this step results in the formation of deoxyerythromycin A and new derivatives useful as antibiotic which have better stability against acids that the corresponding erythromycins. Interruption of the reaction can be effected by an insertion into the eryF gene of a plasmid, gene replacement or chemical or light-induced mutagenesis. The gene is positioned between the eryH and eryG genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New 6-deoxy:erythromycin derivs. - are antibiotics with increased acid stability, produced by cultivation of saccharopolyspora.

                                                                                                                                                                                                                                                                                                               3947885 CGAGTGTGACTTCGTGCGGGACCTGGCCGCCGCCGATGGCGATGGCGGTGATCGGCGACAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, wycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37RV (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of tuberculosis genetics, epidemiology, patient treatment and epidemic monitoring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Evaluating strain variation of Mycobacterium tuberculosis, comprises determining the nucleotide sequence of the strain at positions in the genome corresponding to positions where M. tuberculosis strains CDC 1551 and \rm H37Rv differ -

```
New recombinant pick hydroxylase gene of Streptomyces venezuelae useful for converting ketolides to antibiotics and as antibiotics and intermediates in the synthesis of compounds with pharmaceutical value
```

Columns 41-44; 117pp; English.

production of narbonolide, narbonolide derivatives and polyketides that are useful as antibiotics and as intermediates in the synthesis of compounds with pharmaceutical value. The DNA compounds may also encode a C12-hydroxyalse (picK), desosamine biosynthesis and desosaminyl transferase enzymes (useful for conversion of ketolides to antibiotics), and the beta-glucosidase enzyme (involved in picromycin biosynthesis). These compounds are also useful for increasing the antibiotic activity of a compound relative to the unhydroxylated compound. The recombinant host cells are useful as genetic systems that allow rapid engineering of the narbonolide polyketide synthase. These would be valuable for creating nown to the proposed to the systems that allow rapid engineering contents of the narbonolide polyketide synthase. expressing production creating of the present sequence is used to produce the recombinant DNA compounds the invention. The specification describes a recombinant DNA compound ressing recombinant polyketide synthase genes in host cells for the duction of narbonolide, narbonolide derivatives and polyketides that novel ketolide analogs for pharmaceutical applications

Sequence 5970 BP; 806 A; 2219 C; 2142 G; 800 T; 3 other;
